Immersion Heaters for
up to [40ft deep tanks](#)

The two most important factors in ensuring your [immersion heaters](#) lasts are:

1. Correct Design for the Application

In order to ensure the [immersion heater](#) is correctly designed for the [application](#), you must specify:

- Tank design (length, width, depth, material, restrictions)
- Type of chemistry (solution) to be heated
- Tank temperature and desired heat up time
- Available utilities

2. Keeping the sheath clean

The most common problem with immersion heaters is keeping them clean. Once buildup starts on the sheath, the heat can't escape and this shortens the life of the heater.

3. Electric wiring

If your immersion heater has failed or is not performing correctly, please also check your electric [contacts](#) or [get in touch with our application team](#).

On [our website](#) you can select heaters by type ([over-the-side-immersion](#)-, [bottom or L-shaped](#)-, [screw-plug](#) or [flanged heaters](#)) or by application (Examples: [black oxide](#), [electro-polish](#), [electro-less nickel](#), [phosphoric acid](#), [deep tanks](#)).
