Check your Liquid Level Safety Systems during the Holidays

Liquid level control
for metal finishing
tank

Digital readout
control system with
the timer

The holiday season means irregular work hours, days off and different usage patterns for Liquid Level Heating systems - long holiday weekends or Christmas midweek when the programming of the control systems need to be reviewed.

This applies to the timers on process tanks that allow the tanks typically to come on in the morning and shut off at the end of a typical day for either a 24 hour or 7-day timer.

Setting the controls correctly for the coming days can save the company significant amounts of money!

[Liquid level safety systems](#) with the manual reset switches should be cleaned and tested to ensure they are in correct operating order. This will eliminate a possible failure on Christmas day which could be very costly to your bottom line as well as frustrating for your production crew.

If you require any assistance please [contact us](#) by email or by phone (562) 951-9500.
